However, this time I wanna remove Windows 7 loader and just use Windows 10 loader. I created a new partition for Windows 10 and installed Windows 10 Loader on that partition. But I got an error message when I try to Boot UEFI. It says error: No Boot Device is available. How can I solve this problem? Thanks! A: This question can have two answers: Use Windows 10 Enterprise as UEFI boot option To configure UEFI BIOS to boot from this Windows 10 image: 1. After you download Windows 10 Enterprise edition, follow the instructions here to setup your UEFI BIOS to boot from the Windows 10 installation media. 2. You can use UEFI BIOS option to point to the directory of the Windows 10 installer media. Note that Windows 10 Enterprise is an ISO image, you can use a program like WinImage to create it. If you are using a DVD image: - You need to insert the DVD/CD on a UEFI BIOS compatible machine. - UEFI BIOS option to point to the directory of the Windows 10 installer media. - You need to press DEL during the UEFI setup menu to open the boot options. - You need to set UEFI BIOS to select the Windows 10 installer media. - You need to press ENTER to start the Windows 10 setup. - You can set UEFI BIOS to use the Windows 10 installation media automatically when you reboot the UEFI BIOS setup menu, which makes the system boot into Windows 10 without your intervention. If you are using an USB image: - You need to insert the USB into a UEFI BIOS compatible machine. - You can set UEFI BIOS to use the Windows 10 installer media automatically when you reboot the UEFI BIOS setup menu, which makes the system boot into Windows 10 without your intervention. Use Windows 10 standard as UEFI boot option You can use Windows 10 standard as UEFI boot option without the requirement of Windows 10 Enterprise. Create a new partition for Windows 10 standard Install Windows 82157476af
